

ABSTRACT OF THE DISCLOSURE

A composition for degrading biofilm structure associated with cystic fibrosis and the debris associated therewith comprises an enzyme selected for its ability to dismantle the biofilm structure, 5 and an anchor molecule coupled to an enzyme to form an enzyme-anchor complex. The anchor molecule is selected for its ability to attach to a surface on or proximal the biofilm structure. The attachment to the surface permits prolonged retention time of the enzyme-anchor complex where the biofilm structure and associated 10 debris are present.
